GROSS, C. L. 2005. A comparison of the sexual systems in the trees from the Australian tropics with other tropical biomes—more monoiecey but why? *American Journal of Botany* 92(6): 907–920.

APPENDIX. Sex system and fruit types for 1113 tree species north of 19° S across Qld, NT and WA, Australia. Information was resolved for 1100 species (sex systems) and 1096 species (both sex and fruit type). Species are listed under families according to Stevens (2001 onwards) and in parentheses the *Flora of Australia* family arrangement is given if different from Stevens (2001 onwards). Taxonomic authority follows Hyland et al. (2003). Undescribed species follow the identities used by Hyland et al. (2003). Species status is listed as endemic (e) or native (n) based on Hyland et al. (2003). Code refers to how the sex system was coded for analyses, 1= bisexual, 2= dioecious, 3=;mono ecious and 4 = species information inadequate or conflicting and could not be extrapolated with certainty and species omitted from analyses. Source refers to the authority for the sex system determination and includes herbarium specimens in *italics* with herbaria listed according to Holmgren et al. (1990). Fruit type was derived from the *Flora of Australia* Series, Morley and Toelken (1983), taxonomic treatments or from Hyland et al. (2003). Subspecies and varieties are also listed giving a total of 1142 taxa. Data were analyzed at the species level.
